## 2019 Fourth Quarter Commentary All-Cap Value & Large-Cap Value

January 2020

If 2018 was a year where nothing besides cash worked, 2019 was its mirror image – virtually every type of investment soared in price. The Russell 3000<sup>®</sup> Value Index (R3000V) and Russell 1000<sup>®</sup> Value Index (R1000V) rose 26.3% and 26.5%, respectively, for the year, while the more growth-oriented S&P 500<sup>®</sup> Index increased 31.5%. Our All-Cap Value (ACV) SMA and Large-Cap Value (LCV) SMA composites climbed 22.7% and 22.6%, respectively (gross)\*. Net of a 3% hypothetical maximum annual SMA fee, results for both ACV and LCV were 19.1% for the year. Over the fourth quarter, the R3000V rose 7.5%, while the R1000V increased 7.4%. Our ACV SMA and LCV SMA composites both climbed 5.7% (gross)\*. Net of a 3% hypothetical maximum annual SMA fee, results for ACV and LCV were 4.9% for the quarter.<sup>1</sup>

### Investment Environment

Since our inception in 1986, there have been 10 calendar years when the Russell 3000 Value produced a return of 20% or greater. In those years, our capture ratio has averaged 84%. While we are never happy to lag the market, our 86% capture ratio this year was slightly better than our historic average in strong markets. Though many factors can affect returns and relative results remain variable, the reasonable predictability of this outcome is a function of the consistency of our investment process.

This year's strong equity market performance was driven by significant valuation expansion despite anemic earnings growth. As a proxy for the broad market, 2019 S&P 500 operating, or pro-forma, earnings per share are expected to be approximately flat compared to last year, yet the multiple paid on those earnings expanded 29%.<sup>2</sup> When coupled with dividends, this multiple expansion represented nearly all of the S&P 500's performance in 2019. While our valuation models allow us to pay a premium for growth, there is a limit. When it's reached, we're quick to sell, reducing price/valuation risk in the process, no matter how much we may like a holding. While this sometimes costs us relative performance, particularly in strong up markets, our price discipline has served us well over our history.

To elaborate, we've sold nine stocks since the beginning of June 2018, representing 14% of our model portfolio at time of sale. Of these, six stocks, representing 10% of model weight, were sold purely for valuation reasons – we still like the companies, but valuations had become too rich to justify holding them. Only the decision to sell one of the six, Cisco, subsequently was additive to performance, as it has dropped in value since our sale. The performance of the remaining five – Microsoft, Taiwan Semiconductor, Qualcomm, Procter & Gamble and Walmart – is detailed below:

|                              | Average Since Sold |            | Average Valuation |
|------------------------------|--------------------|------------|-------------------|
|                              | Price Increase     | EPS Growth | Price/EPS         |
| MSFT, TSM, QCOM, PG, WMT     | 36%                | 6%         | 26x               |
| TSM, QCOM, PG, WMT (ex MSFT) | 30%                | 1%         | 25x               |

VALUE DISCIPLINE • QUALITY FOUNDATION • GROWTH OBJECTIVE

Post-sale, all outperformed the market despite overall earnings that were lackluster, and as a result they now trade at rich valuations. While we won't attempt to forecast where these stocks go in the near-term, their valuations appear to be pricing the group for modest returns or worse over the longer term. We believe missing these gains is part of the price of conservative, valuation-based portfolio management.

The same theme played out broadly in the market last year – little earnings growth coupled with significant valuation expansion – leaving the market poised for modest (or worse) longer-term returns.

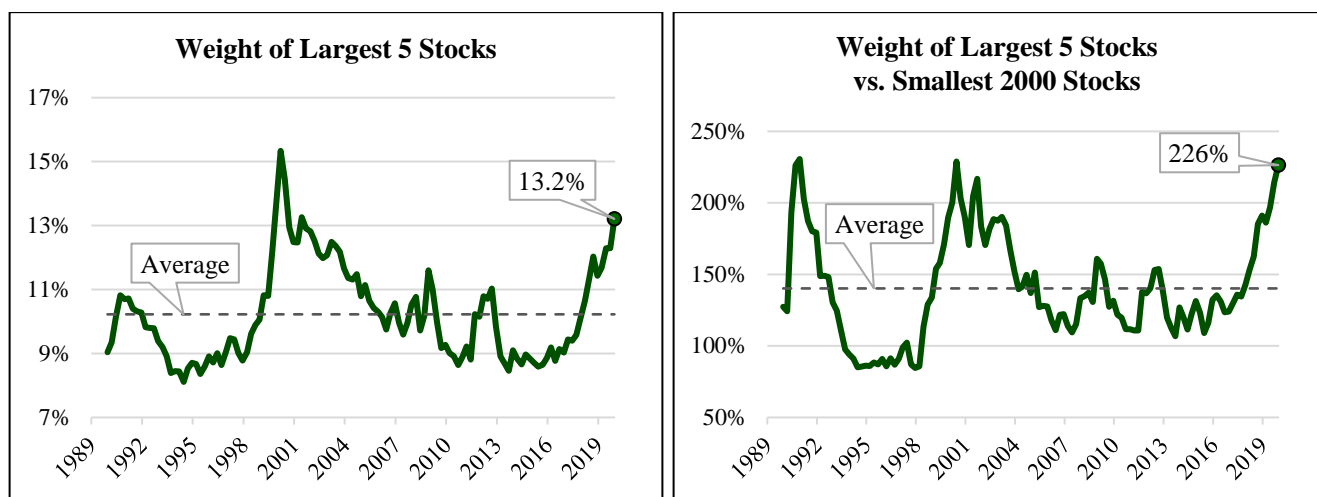

As we close the decade, we reflect on where we are and, though the future is uncertain, where we may be headed. We are now officially in the longest economic expansion since 1945. The 2010s were the first decade without a recession going all the way back to the 1850s.<sup>3</sup> During the last decade, the unemployment rate dropped from 9.9% to 3.5%, 10-year Treasury yields fell from 3.9% to 1.9%, and the S&P 500 posted gains in 9 out of 10 years.<sup>4</sup>

This backdrop colors the current investment environment, one that feels familiar to us. It bears more than a passing resemblance to the market of the late '90s, albeit in most aspects on a somewhat more subdued scale. To elaborate, here are five similarities:

**Market Valuations are Elevated:** Today, the S&P 500 trades at approximately 19.4x next twelve-month pro-forma earnings, above long-term averages, though not as high as the late '90s. This valuation is predicated on: 1) strong 2020 expected earnings growth (history has shown that actual tends to disappoint versus original expectations), and 2) historically high expected margins across all sectors. Should either of these fail to materialize, that valuation will move higher (absent any stock-price changes), maybe significantly so. For perspective, the market currently trades at approximately 25x trailing twelve-month GAAP earnings.<sup>5</sup>

**Other Signs of Optimism Abound:** The percentage of unprofitable IPOs has matched or overtaken both 1999 and 2008 levels, and the overall percentage of money-losing public companies is close to an all-time high, yet most indices are also at record highs.<sup>6</sup> Private-equity deal multiples are at historical highs too, driven by near all-time high leverage,<sup>7</sup> while junk-bond yields are near all-time lows.<sup>8</sup> In short, pricing is indicative of a risk-taking market.

**Winner Take All Mentality:** In the following charts, we are seeing market concentrations led by prominent tech stocks that are at outlier levels. The left-hand chart shows that the top five stocks by market cap (Apple, Microsoft, Alphabet, Amazon and Facebook) currently represent over 13% of the Russell 3000 Index weight. Over the last 30 years, this level was only eclipsed for a few quarters in the blow-off top of the tech bubble.

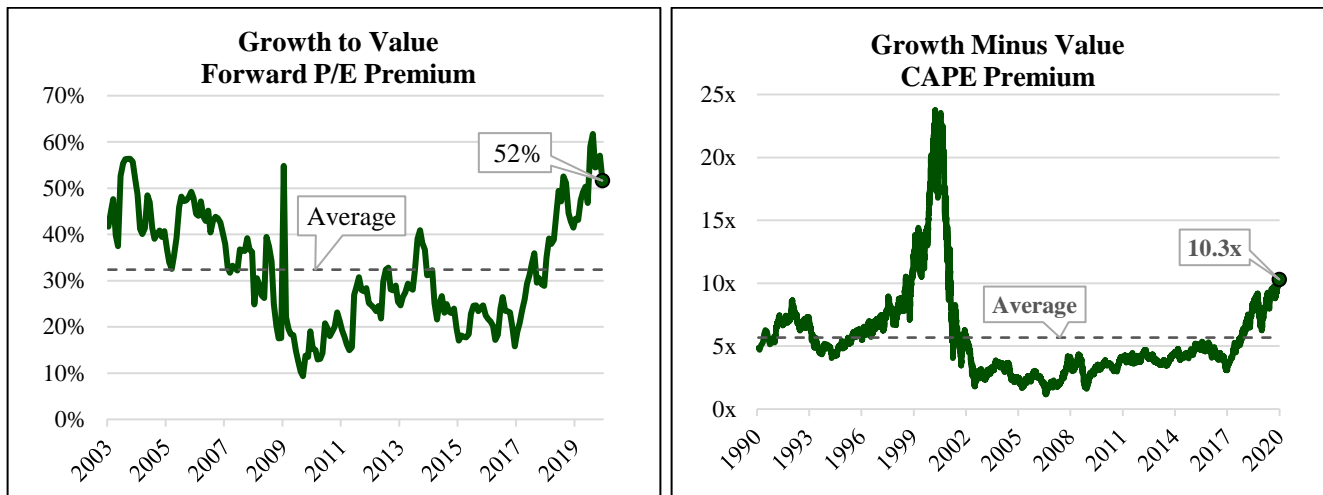

Data Source: S&P Capital IQ, quarterly index weight of Russell 3000 Index constituents.

In the right-hand chart, the weight of these same five stocks is plotted relative to the weight of the bottom 2000 stocks, essentially the entire small-cap universe. Today, the index weight for these five companies is over 2x the index weight of the entire small-cap universe, a level matched only twice in the last 30 years. Not owning these

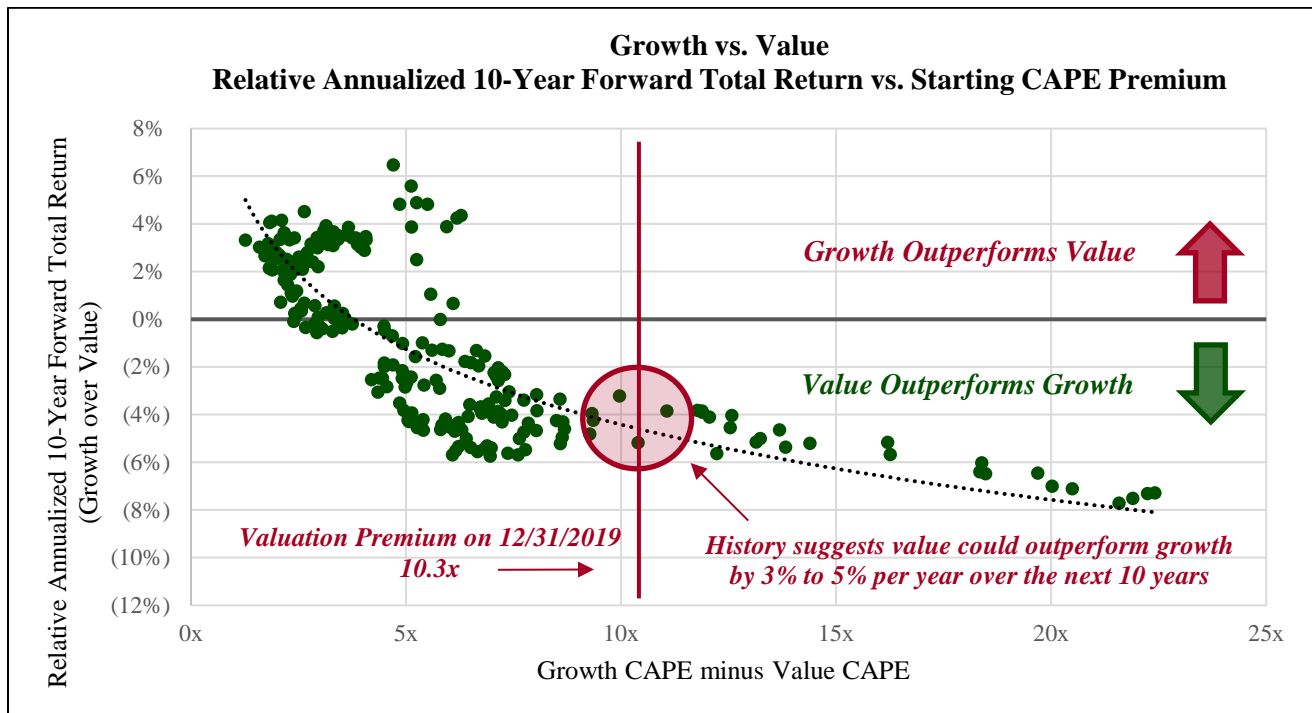

stocks has made it difficult to beat the indices. Nonetheless, history and the law of large numbers suggest that a handful of mega-caps may have difficulty repeating that outperformance in the future.

**Attractive Investment Opportunities:** Despite elevated valuations in general, market volatility over the last couple of years has created significant valuation disparities. While growth typically trades at a premium to value, it recently traded at its highest premium in the last 15+ years (left chart below), despite comparable fundamentals (earnings growth plus dividends).<sup>9</sup> The chart on the right tells a similar tale. It shows the difference between the modified Cycle Adjusted Price-Earnings Ratios (CAPE) of the Russell 1000 Growth and Value.<sup>10</sup> Only the late '90s tech bubble saw higher multiples paid for growth over value. Similar valuation disparities exist between low volatility (expensive) and high volatility (cheaper) stocks, and between large-caps (expensive) and small-caps (cheaper). Our research efforts are focused on these areas of attractiveness.

Data Source: Morningstar Direct<sup>SM</sup> (left chart), see footnote 9; S&P Capital IQ (right chart), see footnote 10.

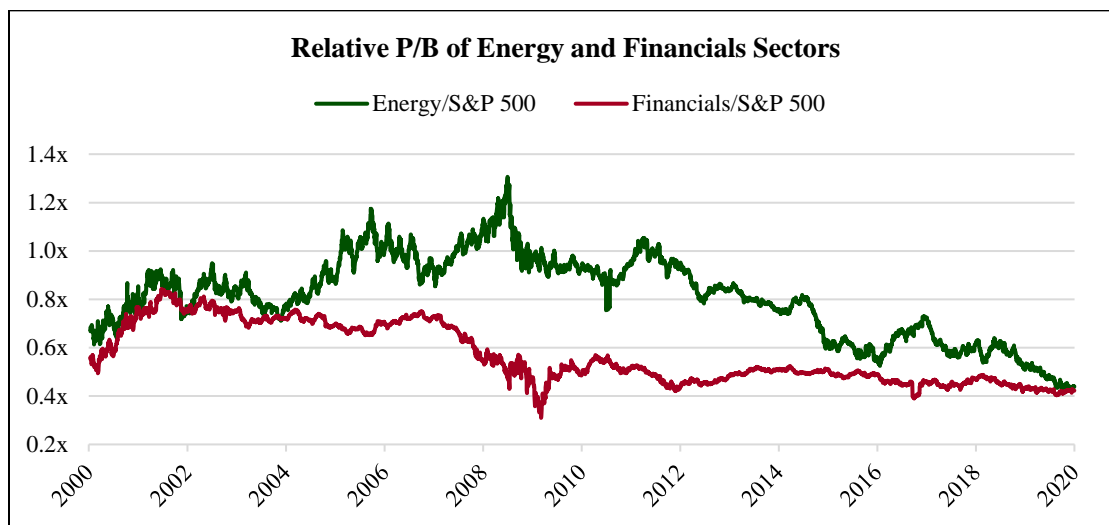

We'd also like to share a chart that shows the historic premium of growth to value, along with the subsequent over/under performance of the two investment styles.<sup>11</sup>

Data Source: S&P Capital IQ, see footnote 11.

Growth generally trades at a premium to value. Beyond a certain point, however, there is a negative correlation between starting relative valuation and subsequent longer term returns. Today's valuation premium of greater than 10x earnings on a modified CAPE basis suggests, if history is a guide, that growth could underperform value by 300 – 500 basis points annually for the next 10 years.

**Manager Style Drift:** As we saw in the late '90s, many value managers today have drifted towards a growth or core approach in an attempt to keep up with a market where growth is the dominant theme. While there are many ways to make money in the market, we believe that value managers are hired for a particular style that is distinct from and often has a low correlation to growth investing. As seen in the chart below, the financials and energy sectors of the S&P 500 currently trade at or near the lowest relative Price/Book (P/B) valuations to the market in 20 years.

Data Source: S&P Capital IQ, P/B ratios of S&P 500 Energy and Financials sectors to P/B ratio of total S&P 500.

Together these two sectors represent roughly 32% of the Russell 3000 Value but only 4% of the Russell 3000 Growth index.<sup>12</sup> If a “value” manager is not invested in these areas, instead focusing their time and attention on large-cap technology, they may be earning superior short-term returns versus the value index, but they may be drifting from their stated style and thus offering little diversification benefit. Our representative All-Cap Value portfolio’s weighting in these two sectors is currently 34%.

**Portfolio Review**<sup>13</sup>

In October, we purchased a new position in Discovery, an operator of cable television networks specializing in unscripted content. In addition to its namesake Discovery Network, the company’s networks include HGTV, Food Network, Travel Channel, Investigation Discovery, OWN and TLC. Internationally, it also owns the popular Eurosport Network. The company attracts loyal viewers to its programming in attractive targeted demographics, which has led to rising advertising revenue. Carriage fee revenue is pressured by cord-cutting, but over-the-top streaming services, which overwhelmingly include Discovery’s channels in their bundles, help offset traditional cable losses. Overall, earnings and cash flow have grown while the concerns about cord-cutting have led to a weak stock price over the past several years, resulting in an attractive entry valuation. Strong margins, return on capital and cash flow all support the investment case for Discovery.

For the quarter, aside from numerous trades harvesting tax-losses, we trimmed existing positions in Kroger and Target. Kroger continues to face intense grocery competition. While the stock has been volatile during our ownership period, we have added and trimmed advantageously, with good results. Our trim in the fourth quarter followed an 18% rise in the stock price since we added to the position in the third quarter. Target was our best performing stock in 2019. While earnings growth has resumed and Target’s online initiatives are gaining traction, the stock price reflects much of the good news and we reduced our position size.

Thank you for your continued partnership with EIC and the trust you have placed in us.

<sup>9</sup>Russell 3000 Growth forward P/E premium over Russell 3000 Value forward P/E as a percentage of Russell 3000 Value forward P/E, calculated for each month-end January 31, 2003 to December 31, 2019. Forward P/E is price/projected earnings calculated by Morningstar based on the asset-weighted average of each company's month-end share price to estimated earnings per share for the company's fiscal year.

<sup>10</sup>Russell 1000 Growth modified CAPE premium over Russell 1000 Value modified CAPE calculated for each month-end January 31, 1990 to December 31, 1990, and daily from January 1, 1991 to December 31, 2019. Modified CAPE is the ratio of index prices to trailing 10-year index level earnings before taxes (EBT) on a time-weighted basis. Annual index level EBT is imputed by dividing the year-end index price by an aggregated price to EBT multiple of index constituents. Price to EBT is calculated by aggregating the available year-end market value of index constituents to the available adjusted trailing twelve months EBT (excluding unusual items) of index constituents.

<sup>11</sup>Russell 1000 Growth modified CAPE premium over Russell 1000 Value modified CAPE (x-axis) for each month-end January 31, 1990 to December 31, 2019, plotted against the subsequent annualized 10-year forward total return difference between the Russell 1000 Growth and Russell 1000 Value (y-axis) for each month-end January 31, 1990 to December 31, 2009. Annualized 10-year forward total return data is unavailable subsequent to December 31, 2009.

# All-Cap Value SMA Composite Performance Description

Equity Investment Corporation (EIC) is an SEC registered independent investment advisor incorporated in the state of Georgia. EIC was founded in 1986. Effective September 30, 2016, substantially all of the assets and liabilities of the firm were acquired by three members of the investment team who collectively have more than 40 years of experience at EIC. Accounts continue to be managed using the same investment process, and the firm continues to operate as EIC. Performance numbers (beginning July 1, 1995) are the value-weighted, time-weighted, total return composite results of fully discretionary All-Cap Value equity wrap fee (SMA) accounts. The strategy employs a flexible framework (not constrained by any cap size limitations) of investing in high-quality, well-managed companies, while at the same time avoiding those that look inexpensive relative to their historical record but are actually in structural decline. Prior to January 1, 2013, the composite was called the All-Cap Value Wrap Composite. Returns are generally presented net of foreign withholding taxes on dividends, interest income, and capital gains; however, returns for some accounts are presented gross of foreign taxes depending on the treatment by their custodian. Prior to July 1, 1995, the returns are that of the All-Cap Value composite. Results for the period January 1, 1989, through July 1, 1995, include both SMA and non-SMA accounts. During this period, SMA accounts represent on average 24% of the composite. Since July 1, 1995, SMA accounts comprise 100% of the composite. The composite creation date is July 1, 1995. All accounts included in the composite are managed according to similar investment guidelines. On January 1, 2003, the benchmark (which excludes an advisory fee) was changed retroactively from the S&P® 500 Index to the Russell 3000® Value Index, which is more representative of the composite. Performance includes reinvestment of dividends, and EIC's returns also include interest earned on cash. The Russell 3000® Value Index measures the performance of the largest 3000 US companies in the value segment of the US equity universe. The Russell 3000® Value Index is based on the Russell 3000® Index, a market-capitalization weighted equity index representing approximately 98% of the investable US equity market.

## Table Notes:

<sup>1</sup> \*Gross returns, presented as supplemental information, are “pure” gross and do not reflect the deduction of any expenses, including trading costs, for SMA accounts. “Pure” gross returns from 10/1/02 through 12/31/06, reflect the deduction of trading costs but not any additional expenses. For the period 1/1/89 through 7/1/95, SMA accounts represent on average 24% of the composite assets. Prior to 7/1/95 and for the periods 10/1/02 through 12/31/06, the returns are that of EIC’s All-Cap Value composite. For all other periods, SMA accounts represent 100% of the composite assets. Net returns are calculated by reducing gross returns with an annual SMA fee of 3.0%, applied monthly.

<sup>2</sup> Dispersion is an asset-weighted standard deviation for the accounts in the composite for the entire year (or year-to-date). “N/A” represents when dispersion is not statistically meaningful due to an insufficient number of portfolios in the composite for the entire year. For 1986 through 1995 dispersion represents EIC’s All-Cap Value composite, which contains both SMA and non-SMA accounts. For 1996 through 2005, dispersion represents EIC’s internally administered SMA accounts.

<sup>3</sup> Number of Portfolios/Composite Assets significantly decreased in 2016 due to transitioning of a major SMA program to a model based (UMA) program during Q416.

<sup>4</sup> “Total Assets” include our regulatory assets under management (“GIPS® Firm Assets”) and our advisory-only “UMA Assets”. EIC has no trading discretion for UMA accounts and provides a model portfolio to the program sponsor or overlay manager. The “UMA Assets” and “Total Assets ” amounts are shown as supplemental information.

Additional Notes: The three year annualized standard deviation measures variability of the composite (gross of fees) and the benchmark returns over the preceding 36 month period.

Performance has been measured on a monthly basis from January 1, 1986, to present. Periods are geometrically linked to obtain the quarterly and annual results. Eligible new accounts are added to the composite at the beginning of the first full quarter under EIC management. Trade-date accounting with monthly valuations and adjustments for large cash flows are used. Results are based on fully discretionary accounts under management, including those accounts no longer with the firm. The US Dollar is the currency used to express performance. Returns include the reinvestment of all income. There were non fee-paying accounts during the following years: 1986: 100%; 1987: 36%; 1988: 2%; 1999-2000: 1%; 2010 – 2017: <1%. There are no non fee-paying accounts during any other period. Economic and market conditions have differed over the time period displayed, and likewise will be different in the future. Policies for valuing portfolios, calculating performance and preparing compliant presentations are available upon request.

EIC claims compliance with the Global Investment Performance Standards (GIPS®) since inception and has prepared and presented this report in compliance with the GIPS® standards. EIC has been independently verified for the periods January 1, 1986, through September 30, 2019. Verification assesses whether (1) the firm has complied with all the composite construction requirements of the GIPS® standards on a firm-wide basis and (2) the firm’s policies and procedures are designed to calculate and present performance in compliance with the GIPS® standards. Verification does not ensure the accuracy of any specific composite presentation. The verification reports, as well as a complete list and description of all the firm’s composites, are available upon request by contacting Equity Investment Corporation, 1776 Peachtree Street NW, Suite 600S, Atlanta, GA 30309. Prospective clients should be aware that results are historical and do not imply future rates of return or volatility for EIC or the indices, which may be materially different from the past and from each other.

Investment management fees are based on market values of the assets under management. In addition to a management fee, some accounts pay an all-inclusive fee based on a percentage of assets under management. Other than brokerage commissions, this fee includes portfolio monitoring, consulting services, and in some cases, custodial services. EIC’s maximum annual fees for SMA accounts (charged quarterly) are 0.75%. Total fees charged may equal 3% per year. SMA schedules are provided by independent SMA sponsors and are available upon request from the individual sponsor. Further information about fees and compensation is discussed in EIC’s form ADV Part 2 ([www.adviserinfo.sec.gov](http://www.adviserinfo.sec.gov)).

# Large-Cap Value SMA Composite Performance Description

Equity Investment Corporation (EIC) is an SEC registered independent investment advisor incorporated in the state of Georgia. EIC was founded in 1986. Effective September 30, 2016, substantially all of the assets and liabilities of the firm were acquired by three members of the investment team who collectively have more than 40 years of experience at EIC. Accounts continue to be managed using the same investment process and the firm continues to operate as EIC. Performance numbers are the value-weighted, time-weighted, total return composite results of fully discretionary large-cap value wrap fee (SMA) accounts managed in the style of the firm's traditional value methodology with a large-cap bias. The strategy employs a flexible framework of investing in high-quality, well-managed companies, while at the same time avoiding those that look inexpensive relative to their historical record but are actually in structural decline. Prior to January 1, 2013, the composite was called the Large-Cap Value Wrap Composite. Returns are generally presented net of foreign withholding taxes on dividends, interest income, and capital gains; however, returns for some accounts are presented gross of foreign taxes depending on the treatment by their custodian. The composite creation date is January 1, 2001, and SMA accounts comprise 100% of the composite. For comparison purposes the composite is measured against the Russell 1000® Value Index, which excludes an advisory fee. On January 1, 2003, the benchmark was changed retroactively from the S&P 500® Index to the Russell 1000® Value Index, which is more representative of the composite. The Russell 1000® Value Index measures the performance of the large-cap value segment of the US equity universe. It is a subset of the Russell 3000® Value Index and includes those Russell 1000® companies with lower price-to-book ratios and lower expected long-term mean earnings growth rates. The Russell 1000® represents approximately 90% of the investable US equity market.

<sup>1</sup> \*Gross returns, presented as supplemental information, are “pure” gross and do not reflect the deduction of any expenses, including trading costs, for SMA accounts. Net returns are calculated by reducing gross returns by an annual SMA fee of 3.0% (0.75%/quarter during 2001 and 0.25%/month thereafter).

<sup>2</sup> Dispersion is an asset-weighted standard deviation for the accounts in the composite the entire year (or year-to-date). “N/A” represents when dispersion is not statistically meaningful due to an insufficient number of portfolios in the composite for the entire year.

<sup>3</sup> Number of Portfolios/Composite Assets significantly decreased in Q4 2014 and Q4 2016 due to transitioning of two major SMA programs to model based (UMA) programs.

<sup>4</sup> “Total Assets” include our regulatory assets under management (“GIPS® Firm Assets”) and our advisory-only “UMA Assets”. EIC has no trading discretion for UMA accounts and provides a model portfolio to the program sponsor or overlay manager. The “UMA Assets” and “Total Assets” amounts are shown as supplemental information.

Additional Note: The three year annualized standard deviation measures variability of the composite (gross of fees) and the benchmark returns over the preceding 36 month period.

Performance has been measured on a monthly basis from January 1, 2001, to present. Periods are geometrically linked to obtain the quarterly and annual results. Eligible new accounts are added to the composite at the beginning of the first full quarter under EIC management. Trade-date accounting with monthly valuations and adjustments for large cash flows are used. Results are based on fully discretionary accounts under management, including those accounts no longer with the firm. The US Dollar is the currency used to express performance. Returns include the reinvestment of all income. During 2002, 2% of the assets are non-fee paying accounts. There are no non-fee paying accounts during any other period. Economic and market conditions have differed over the time period displayed, and likewise will be different in the future. Policies for valuing portfolios, calculating performance and preparing compliant presentations are available upon request.

EIC claims compliance with the Global Investment Performance Standards (GIPS®) and has prepared and presented this report in compliance with the GIPS® standards. EIC has been independently verified for the periods January 1, 1986, through September 30, 2019. Verification assesses whether (1) the firm has complied with all the composite construction requirements of the GIPS® standards on a firm-wide basis and (2) the firm's policies and procedures are designed to calculate and present performance in compliance with the GIPS® standards. The Large-Cap Value SMA composite has been examined for the periods January 1, 2001, through September 30, 2019. The verification and composite examination reports, as well as a complete list and description of the firm's composites, are available upon request by contacting Equity Investment Corporation, 1776 Peachtree Street NW, Suite 600S, Atlanta, GA 30309. Prospective clients should be aware that results are historical and do not imply future rates of return or volatility for EIC or the indices, which may be materially different from the past and from each other.

Investment management fees are based on market values of the assets under management. In addition to a management fee, some accounts pay an all-inclusive fee based on a percentage of assets under management. Other than brokerage commissions, this fee includes portfolio monitoring, consulting services, and in some cases, custodial services. EIC's maximum annual fees for SMA accounts (charged quarterly) are 0.75%. Total fees charged may equal 3% per year. SMA schedules are provided by independent SMA sponsors and are available upon request from the individual sponsor. Further information about fees and compensation is discussed in EIC's form ADV Part 2 ([www.adviserinfo.sec.gov](http://www.adviserinfo.sec.gov)).
